

- the instructions given are indicative.If you have something better to suggest, it's welcome to discuss.
- some ready-made scripts mentioned if you can't find them yourself, we can find them
- The script 'Rocket LMS' is multi-language, we must be able, after your change, to translate it
- Also, where there is Import/Export, the corresponding fields should be created according to each task.
- the (+) are extra features that we want added to the script

Tasks for V3
3.1 Paste last Scripts changes 1.9 -> 2.0
3.2 Common units and conversions
3.3 External Connections
3.4 Add Laravel spatial + add "Nearby" filter in 'search form'
3.5.1 Booking + Bundles + create import ability
3.5.2 Booking -> Many Templates
3.6 Modular Checkout System
3.7 Advance 'Search Bar'
3.8 API + MailWizz + Import/Export ability
3.9 Roles - Access Levels

Appendix I) [Credentials](#)

Appendix II) [Software we provide](#)

Appendix III) [Older Modifications](#)

3.1) Paste last Scripts changes 1.9 -> 2.0

paste the changes that have been made from the developer of the 'Rocket LMS' script. Now we have the 1.9 version and must paste the version 2.0 changes

We want you to upload the project to your own GitHub so we can see exactly what changes are being made. (Ideally, with comments.)

Version 2.0 - Release Date: 07 August 2025

New: Integrated with Rocket LMS Theme and Landing Builder
New: 12 Demo themes and landing pages
New: Multi-theme support added
New: Landing page builder structure added
New: Automatic license validation system integrated into Rocket LMS
New: Completely redesigned main theme
New: Completely redesigned admin panel
New: Completely redesigned dashboards for all user roles
New: New flexible header and footer design
New: Variable cards for different items (courses, bundles, etc.)
New: New landing page for blog
New: New landing page for store
New: New instructor finder page
New: Event calendar added
New: Dark mode support
New: Integrated whiteboard system for live classes
New: New meeting booking wizard
New: New dashboard widgets for assignments, subscriptions, and more
New: Redesigned learning page
New: New advertising modal design
New: Enhanced video player
New: Flexible header and footer structure
New: Flexible card components added
New: Improved empty state views
New: New modal designs
New: New toast notification designs
New: New icon pack and icon picker
New: New contact us page
New: General security improvements
New: New creation wizard for courses, bundles, and more
New: AJAX search added to user panel lists
New: Redesigned search result page
Fix: All reported bugs have been resolved

Version 1.9.9 - Release Date: 05 March 2025

Improved: Quiz Review feature
Improved: TAX Settings
Fix: Reported bugs resolved

3.2) Common units and conversions

3.2.1 Must connect Currencies with API, for 12 hours “Currency Exchange Rates”

- Fallback Mode → if the API goes down, keep the latest exchange rates.
- Historical exchange rates → for reporting/pricing.
- Multiple APIs failover → primary + backup provider. (currencylayer.com)
- Admin Toggle: in Rocket LMS settings → financial settings, you can add an option “Auto-update currency via API”.
<https://lms.rocket-soft.org/admin/settings/financial?tab=currency>
- Cache: store in Redis/DB for speed ??

GOAL->

Implement a currency and measurement unit management system in Rocket LMS, with a connection to an exchange rate API (with caching, fallback, and historical data) and user preferences for selecting units (e.g., length, mass, area). Conversions will be done centrally through a service class and will be automatically applied to checkout, reports, and course data, so that each user sees prices in their preferred unit/currency.

API-> <https://exchangeratesapi.io/>

Documentation-> <https://exchangeratesapi.io/documentation/>

1) Choose an API provider

- Primary (e.g. Open Exchange Rates or CurrencyLayer).
- Backup (e.g. ExchangeRate.host, because it's free).

2) Get an API key (only for the primary)

- Register with the provider.
- Get an API_KEY that will be placed in Laravel's .env.

3) Rocket LMS / Laravel settings

- Add a configuration (e.g. exchange.php) where you declare the provider, API key, base currency, update interval.
- Give the admin the option to enable/disable “Auto-update currency via API”.

4) API Connection

- Rocket LMS (via Laravel service) sends a request to the API endpoint.
- It gets back the rates in JSON.

5) Storage & Caching

- You store the rates in a database or cache (Redis, DB table).
- You set a lifetime (e.g. every 12 hours to be refreshed).

6) Fallback

-If the primary API does not respond, you call the backup API.

-If it does not respond either, you use the last stored values.

7) Use within Rocket LMS

-In checkout, reports, course/product listings → when a currency conversion is needed, you read the latest rate.

-You apply the formula (e.g. USD → EUR).

8) Cron Job / Scheduler

-You set up an automatic process (e.g. every 12 hours) to fetch new exchange rates and update the system.

3.2.2 Change way of Choosing: Locale, Currency, etc

1. Database / Settings Layer

- Add new fields in the user profile/preferences table to store unit selections (e.g. `preferred_length_unit`, `preferred_area_unit`, `preferred_mass_unit`).
- Define default values in the `settings` table or `.env` so new users start with predefined units.

2. Configuration / Mapping

- Create a central config file (e.g. `config/units.php`) that defines available units:

Example:

```
php

return [
    'length' => [
        'km' => [
            'label' => 'Kilometers',
            'to_base' => function($value) { return $value; }, // base unit
            'from_base' => function($value) { return $value; }
        ],
        'mi' => [
            'label' => 'Miles',
            'to_base' => function($value) { return $value * 1.60934; }, // miles -> km
            'from_base' => function($value) { return $value / 1.60934; } // km -> miles
        ],
    ],

    'temperature' => [
        'C' => [
            'label' => 'Celsius',
            'to_base' => function($value) { return $value; },
            'from_base' => function($value) { return $value; }
        ],
    ],
];
```

3. Conversion Service

- Build a **UnitConversionService** (Laravel Service Class) with standardized methods:
Implement formulas or use a **conversion mapping array**:

4. Frontend Integration

- The UI (dropdowns/radio buttons) should:
 - Fetch **available units** from `config/units.php`.
Save selections to **user settings** (via AJAX/POST).
- Wherever values are displayed (Checkout, Course data, Reports, etc.):
 - Perform **automatic conversion** based on user preferences.
- When an **organization/user enters data** (e.g. car with 50,000 km):
 - Save as **base unit (km)** in the database.
- When another **user views the listing**:
 - Detect their preferred unit (e.g. mi).
 - Run conversion dynamically → show `31068.56 mi`

5. Fallback / Edge Cases

- If the user has no preference → use defaults.
- If a conversion is not defined → show original value + unit.
- For performance, frequently used conversions can be stored in **cache**.

6. Base Storage Principle

- Always store values in **one standard/base unit** in the database.
 - Example:
 - Distance → **kilometers (km)**
 - Mass → **kilograms (kg)**
 - Temperature → **Celsius (°C)**

GOAL->

We want Rocket LMS to support multiple units of measurement based on user preferences. Values will always be stored in a standard/base unit in the database and will be automatically converted in the display according to the user's choices. There will be a central configuration for the available units, a conversion service for conversions, frontend options for the user, and caching/fallback for performance and reliability.

1)User Preferences

- There should be new fields in the user profile for preferred units (length, mass, area, etc.).
- Set default values from the settings or .env.

2)Configuration

- There should be a central file (e.g. config/units.php) with all available units and conversion rules.

3)Conversion Service

- Implement a service class that will do the conversions (e.g. km → miles, kg → lbs).
- Based on mapping or mathematical formulas.

4)Frontend Integration

- User should be able to select a unit through dropdown/radio buttons.
- Choices should be saved in the user's profile.

-When data is displayed (e.g. checkout, reports, course data):

- Automatic conversion should be performed according to the user's preference.
- When a user enters data (e.g. distance 50,000 km), it should be stored in base unit (km) in the database. Other users should see it converted (e.g. 31,068.56 mi).

5) Fallback & Cache

-If the user has not selected a unit → defaults are used.

-If there is no conversion → the original value + unit is displayed.

-Frequent conversions are cached for speed.

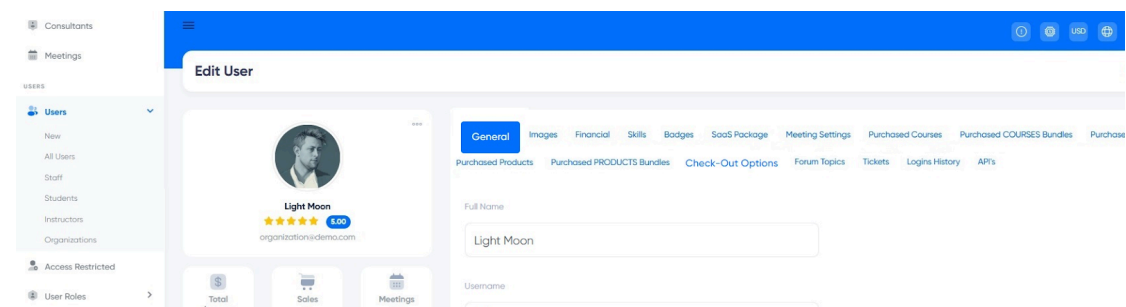

6) Base Storage Principle

-All values in the base are stored in a standard unit. E.g. Distance in km, Mass in kg, Temperature in °C.

-This ensures consistency and ease in conversions.

3.2.1 - 3.8.1) Future State (Admin) (Organization/Instructor) -> Edit#General

<https://lms.rocket-soft.org/admin/users/867/edit>

 (Admin) Organization, Instructor -> User -> Edit 1.2.jpg (Detailed/Extended Image)

 (Admin) Organization, Instructor -> User -> Edit 1.2

<https://lms.rocket-soft.org>

(FrontEnd) Conversions, Cookies & Signed-In.jpg (Common units and conversions)

(Detailed/Extended Image)

3.3) External Connections

GOAL->

The goal is to develop an “External Connections” module for Rocket LMS that allows Instructors and Organizations to integrate their accounts with external calendar systems. The module should provide configuration options for Google Calendar, Microsoft Outlook, and iCalendar, enabling two-way synchronization of bookings and scheduled events. Each integration must support secure authentication (Client ID/Secret, OAuth where required) and allow customization of event details such as title, description, and attendees using dynamic placeholders (e.g., {CUSTOMER_NAME}, {BOOKING_STATUS}, {PRODUCT_NAME}). The system should also include options for event export (e.g., .ics download), debug logging for troubleshooting, and the ability to add customers as event attendees. This ensures that all learning activities, bookings, and schedules created in Rocket LMS remain in sync with the external calendars used by instructors, organizations, and their customers.

IMPLEMENTATION->

1)Database & Models

- Create tables for integrations (calendar_integrations), settings (calendar_settings), mappings (calendar_mappings), and logs (calendar_logs).
- Store provider tokens securely (encrypted) and include fields for sync status, last sync time, etc.

2)OAuth Integration

- Implement authentication flows for Google Calendar and Microsoft Outlook (Client ID, Secret, Redirect URI).
- Handle token storage, refresh tokens, and error states.

3)UI/UX (External Connections Tab)

- Add a new tab in the User/Organization edit page.
- Provide options to connect/disconnect Google or Outlook calendars.
- Display connection status and last sync time.
- Add configuration options (status filters, event templates, add customer as attendee, debug mode).
- Enable iCalendar export toggle and download link for .ics files.

4)Event Templates & Placeholders

- Build a template editor for event titles and details.
- Support dynamic variables such as {CUSTOMER_NAME}, {BOOKING_STATUS}, {PRODUCT_NAME}, {BOOKING_ID}, {START_AT}, {END_AT}, {RESOURCE_NAME}.

5)Outbound Sync (Rocket → External Calendar)

- On booking/session create, update, or cancel, push the event to the connected calendar.
- Store the mapping between Rocket LMS event IDs and provider event IDs.
- Ensure deduplication (avoid duplicate pushes).

6)Inbound Sync (External Calendar → Rocket)

- Set up scheduled jobs to fetch updates from Google/Outlook.
- Update mapped events in Rocket LMS if changes occur externally (time changes, cancellations).
- Define conflict resolution rules (by default Rocket is the source of truth).

7)iCalendar Export

- Provide a signed .ics feed URL for each instructor/organization.
- Allow customers to download or subscribe to events in their own calendar apps.

8)Logging & Debugging

- Store logs for each sync attempt (success, failure, provider response).
- Show debug logs in the admin panel with CSV export option.

9)Error Handling & Retry

- Use Laravel Jobs/Queue for all sync tasks.
- Implement retry policies (exponential backoff).
- Handle API rate limits gracefully.

10)RBAC & Permissions

- Add permissions such as calendar.connect, calendar.configure, calendar.sync.
- Ensure each instructor/organization can only access their own calendar settings.

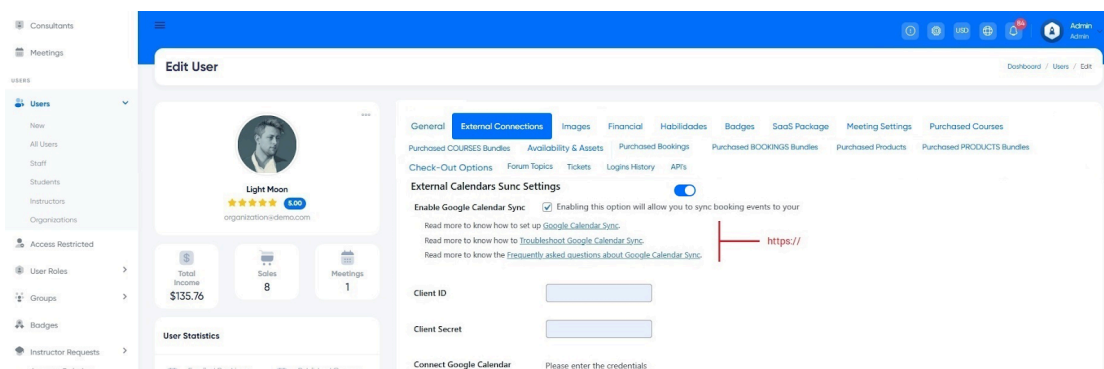

11)Testing & QA

- Unit tests for template rendering and token handling.
- Integration tests for full sync cycle (create, update, cancel).
- End-to-end tests with Google/Outlook sandbox accounts.

12)Rollout & Monitoring

- Enable feature behind a flag.
- Roll out to a small set of organizations first.
- Monitor sync success rate, error logs, and token refreshes.
- Expand to all tenants after validation.

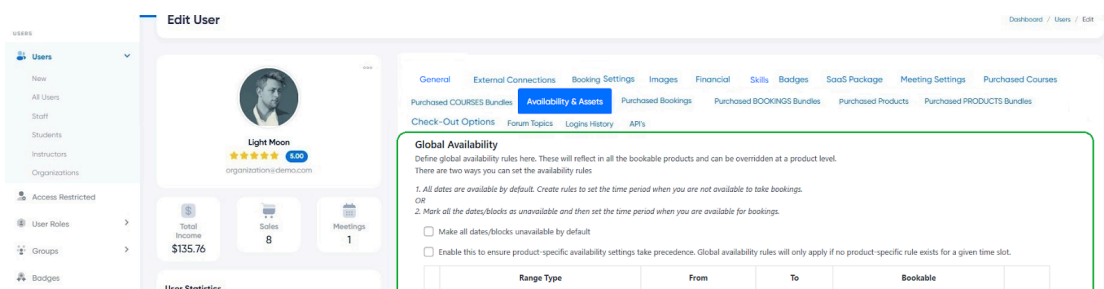

3.3.1) Future State (Admin) -> Setting # External Connections (Organization/Instructor)

 (Admin) Organization,Instructor -> Edit 1.0.1.jpg (Detailed/Extended Image + TXT)

 (Admin) Organization,Instructor -> Edit 1.0.1

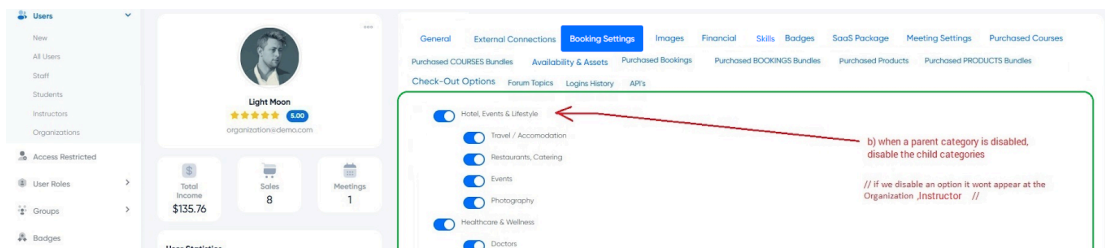

3.5.1.2) Future State (Admin) Availability & Assets (Organization/Instructor)

 (Admin) Organization,Instructor -> Edit 1.4

3.5.1.2) Future State (Admin) Booking Categories (Organization/Instructor)

 (Admin) Organization,Instructor -} Edit 1.3.jpg (Detailed/Extended Image + TXT)

 (Admin) Organization,Instructor -} Settings -} Edit 1.3

3.4) Add Laravel spatial + add "Nearby" filter in 'search form'

p.s. What will going to be for the current "Localisation" Fields ?

 The flow will be:

- Grimzy = for spatial queries (e.g. Nearby search).
- OpenStreetMap API = to "fill" the address fields & the map.
- - Faster registration (auto-fill all fields)
- Frontend = will display the second UI (with map + address) instead of simple localization.

Category	Location	Action Needed
Users (Profiles / Registration)	Front-end Registration / Profile Edit (Student, Instructor, Organization)	Add address fields with autocomplete (geocoding)
Users (Profiles / Registration)	Admin Edit User	Extend forms to support location fields
Users (Profiles / Registration)	User Dashboard -> Profile Update	Enable address editing with map marker
Courses / Products / Bookings	Admin Create/Edit Course/Product/Booking	Add location fields (lat/Ing, address)
Courses / Products / Bookings	Instructor Panel (Front-end) -> Create/Edit Course	Add location fields in course creation/editing
Orders / Checkout	Checkout Page (Front-end)	Include address autocomplete for delivery/onsite services
Marketplace Modules	Vendors / Sellers -> Vendor location	Store vendor address/lat-Ing for Nearby filtering

Marketplace Modules	Services -> Service location for each vendor service	Store service location and lat-lng for filtering
Search & Filters	Front-end Search Page (Courses, Products, Bookings)	Implement Nearby/Distance filter and geospatial queries
Search & Filters	API Endpoints (Mobile App)	Support distance filtering in API results
Reporting / Analytics	Admin Reports (User Activity / Sales by Location)	Extend reports to support geolocation analytics
Forms	Create/ Edit Forms	

We want to expand the system so that, in addition to the existing localization fields (language, time zone, currency), it also supports geographic data (address, latitude, longitude). This will enable:

- faster user registration with automatic address completion,
- location storage for users, vendors, courses, bookings,
- search capability with Nearby/Distance filters and spatial queries,
- display of maps and markers on the frontend,
- geography-based reports & APIs.

Important: the existing localization fields **remain unchanged**. Geolocation is an **additional layer**.

Users (Profiles / Registration)

- Front-end Registration/Profile Edit: addition of address autocomplete (OpenStreetMap API).
- Admin Edit User: support for location fields.
- User Dashboard -> Profile Update: ability to edit address with map marker.

Courses / Products / Bookings

- Admin Create/Edit: add address + lat/lng.
- Instructor Panel -> Create/Edit Course: same functionality for instructors.

Orders / Checkout

- Front-end Checkout Page: address autocomplete for delivery/onsite services.
- Marketplace Modules
- Vendors -> save vendor address + lat/lng for Nearby filtering.
- Services -> store location for each service.

Search & Filters

- Front-end Search Page (Courses, Products, Bookings): Nearby/Distance filter with spatial queries (Grimzy).
- API Endpoints (Mobile App)

-Support distance filtering in results.

Reporting / Analytics

-Reports with activity/sales by location.

1. Database

- Add new fields:
 - `address_line`, `city`, `country`, `postal_code`
 - `lat`, `lng` (decimal)
 - `location` (POINT) with spatial index
- Apply these to tables: `users`, `vendors`, `courses`, `products`, `bookings`, `orders`.

2. Backend

- Save/read address + lat/lng.
- Use **spatial queries** for distance-based searches.
- Provide a helper method, e.g. `nearby($lat, $lng, $radiusKm)`, to simplify usage.

3. Frontend (Forms & UX)

- **Registration / Profile:**
 - Address autocomplete (OpenStreetMap API).
 - Map marker (draggable) to set the location.
- **Admin / Instructor / Vendor Panel:**
 - Same functionality when creating or editing courses, services, vendors.
- **Checkout:**
 - Address autocomplete, with an option "Use my profile address".

4. Search & Filters

- In search (courses/products/bookings):
 - Add a **Nearby filter** → input address + radius (km).
 - Results should be ordered by distance.

5. API

- New parameters: `lat`, `lng`, `radius_km`.
- Return `distance_km` when a Nearby search is used.

6. Reports

- Reports for sales/activity by city or country.
- Export CSV/Excel with geographic data.

7. Acceptance Criteria

- Users can save/edit their address with map support.
- Nearby search correctly shows results within the selected radius.
- Existing localization fields (language/timezone/currency) remain unchanged.
- APIs accept `lat/lng` and return `distance`.

Kidney Lakes Utah, United States

Kidney Lake Utah, United States

3.5.1 Booking + create import ability

tools

1. Main scripts
 - Rocket LMS → database (users, roles, checkout, orders/invoices).
 - pluginhive bookings & appointments → for daily bookings (accommodation, rentals, tours, extras).

-ReadyBook → for hourly appointments (appointments: time-slots, durations, buffers, reminders).

2. Integration & backend

- Laravel Sanctum / JWT → common login/session (SSO).
- Custom mapping tables → connect Rocket orders with reservations/appointments.
- Laravel Queue (Redis) → for reservations, reschedule, reminders, emails.
- Cache (Redis/Memcached) → for availability & pricing.

3. Notifications & reminders

- Laravel Notifications (Mail, SMS, Push).
- SMTP → transactional emails.
- SMS provider (Twilio / MessageBird).
- Push provider (OneSignal / FCM).

4. UI/UX

- Blade/Tailwind (Rocket LMS theme) → common UI wrapper.
- Date-range picker (Booking Core).
- Time-slot picker (ReadyBook).
- Panel extensions (instructor/organization: "Bookings / Services" tab).
- User panel: My Bookings with cancel/reschedule/invoice.

5. Monitoring / Scaling

- Laravel Horizon → for queues monitoring.
- Supervisor → for job workers.
- Server caching → Redis or Memcached.
- Logging → Laravel Telescope or Sentry for errors.
- Availability matrix

<https://www.pluginhive.com/product/woocommerce-booking-and-appointments/#tab-title-description>

<https://www.pluginhive.com/product/woocommerce-recurring-bookings-and-appointments/#tab-title-description>

<https://www.pluginhive.com/product/woocommerce-multiple-non-adjacent-bookings/#tab-title-description>

-

LEVELs: **Admin + Backend (Organizations/Instructors) + FrontEnd**

GOAL->

As on yrreadybiz.com, courses and products , we now want to display "Booking" services (below are the booking services) to appear in the menu of instructors and organizations (like products & courses).

then be displayed to users/customers so that they can purchase this service

Booking:

- Real Estate & Home
- 2. Lifestyle & Events
- 3. Healthcare & Wellness
- 4. Automotive & Technical
- 5. Tutoring & Trainers

- 6. Consulting, Legal & Finance

IMPLEMENTATION->

- +Services/Appointments: ReadyBook time-slots (durations 30'/60', buffers, lead/cutoff, reschedule, reminders).
- +Advanced pricing: Booking Core rules (per day/season/DOW, pax/variants adults/children, promos, taxes, deposits/split).
- +Variants & Specs: Booking Core multi-dimension (mode, language) + attributes (Wi-Fi, wheelchair, etc.) for availability/price/filters.
- +Policies & Bundles: ReadyBook + Booking Core cancel/reschedule/no-show; custom for packages & course+booking bundles.
- +Integration with Rocket: shared auth/users, unified checkout, ERP billing, widgets (date-range from BC, slot-picker from RB).
- +Admin & Vendor tools: Booking Core rate calendar/bulk edits/closures; ReadyBook slot templates & calendars; custom reports (occupancy, revenue).
- +Notifications: unified templates (email/SMS/push), reminders & reschedules via queues (Redis).
- +2-way calendar sync (opt.): ReadyBook → Google/Microsoft calendars (day/week/month).
- +Performance/Scaling: cache layer for availability/pricing, job queues for ERP/reminders, monitoring with Horizon.

-Architecture

- New Booking module within Rocket LMS (Laravel).
- Use of the same auth/users and existing checkout/orders.
- New roles/rights for instructors & organizations.

-Database

- Listings (Accommodation, Beauty, Rentals, Restaurants, Repair, Services).
- Resources (rooms, providers, vehicles).
- Rate Plans / Seasons / Rules for advanced pricing.
- Availability / Time Slots for services with duration, buffers, lead/cutoff.
- Bookings with status, pax (adults/children), variants, policy, price.
- Policies (cancel, reschedule, deposits, no-show).
- Variants & Specs (multi-dimension options, attributes for filters).
- Packages (e.g. 5 sessions bundle).
- etc.

-Engines

- PricingEngine: calculates price in order (base → season → DOW → duration → pax → promo → taxes).
- SlotEngine: creates slots with rules, buffers, reschedule.
- NightlyAvailability: for accommodations (date-range validation).

-API / Functions

- Price quote & availability (per day or per slot).
- Create, cancel, reschedule booking with policies.
- Vendor calendar (day/week/month).
- Integration with ERP (invoice, credit note).

-UI / Experience

- Vendor menu: Bookings (next to Courses/Products).
- Widgets: Date-range picker (accommodation), Time-slot picker (services).
- User: My Bookings (list, reschedule, cancel, invoice link).
- Admin/Vendor tools: Rate calendar, slot templates, reports.

-Notifications

Emails/SMS/push: confirmation, reminders (T-24h/T-1h), reschedule/cancel.
Job queues for reliability.

-Integration with Rocket

Same checkout flow
Display widgets on course/vendor pages.

-Extra (Phase B/C)

2-way calendar sync (Google/Microsoft).
Multi-session packages, course+booking bundles.
Advanced reports (occupancy, utilization, revenue split).
Scaling: caching availability, job queues for ERP/reminders.

3.5.1.2) Current State (Admin) Financial Settings

<https://lms.rocket-soft.org/admin/settings/financial?tab=commissions>

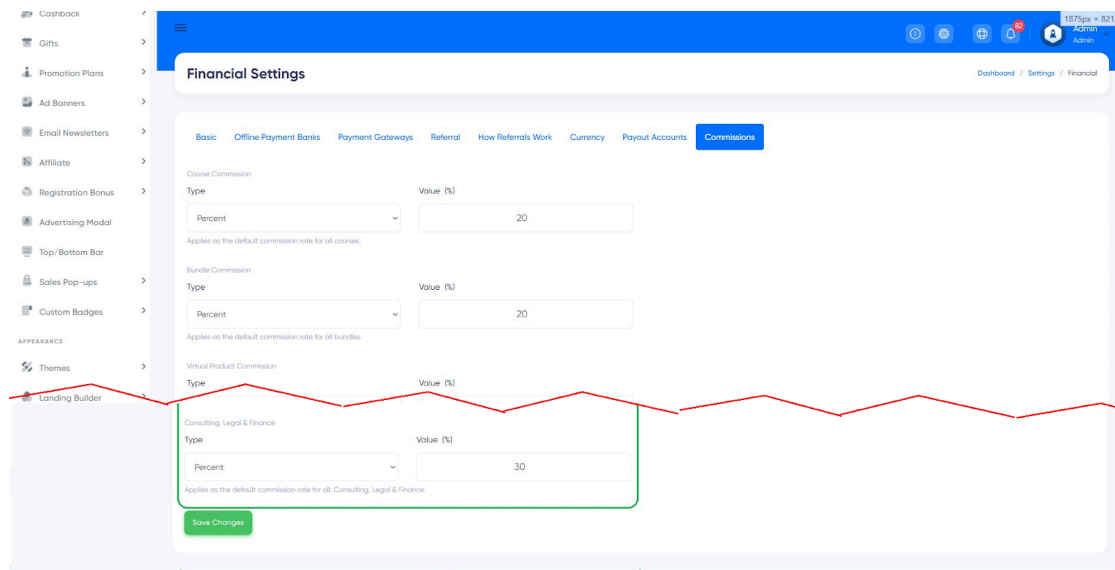

The screenshot shows the 'Financial Settings' page in the admin interface, specifically the 'Commissions' tab. The page has a green header with navigation icons and a user profile 'Admin Jahan'. A left sidebar lists various settings categories like 'Cashback', 'Gifts', 'Promotion Plans', 'Ad Banners', 'Email Newsletters', 'Affiliate', 'Registration Bonus', 'Advertising Modal', 'Top/Bottom Bar', 'Sales Pop-ups', 'Custom Badges', 'APPEARANCE' (Themes, Landing Builder), and 'SETTINGS' (Translator, Settings, Log Out). The main content area is titled 'Financial Settings' and contains several commission settings:

- Course Commission:** Type: Percent, Value (%): 20. Below it: 'Applies as the default commission rate for all courses.'
- Bundle Commission:** Type: Percent, Value (%): 20. Below it: 'Applies as the default commission rate for all bundles.'
- Virtual Product Commission:** Type: Percent, Value (%): 30. Below it: 'Applies as the default commission rate for all virtual products.'
- Physical Product Commission:** Type: Percent, Value (%): 10. Below it: 'Applies as the default commission rate for all physical products.'
- Meeting Commission:** Type: Percent, Value (%): 30. Below it: 'Applies as the default commission rate for all meetings.'

A 'Save Changes' button is located at the bottom of the settings area.

3.6 Modular Checkout System

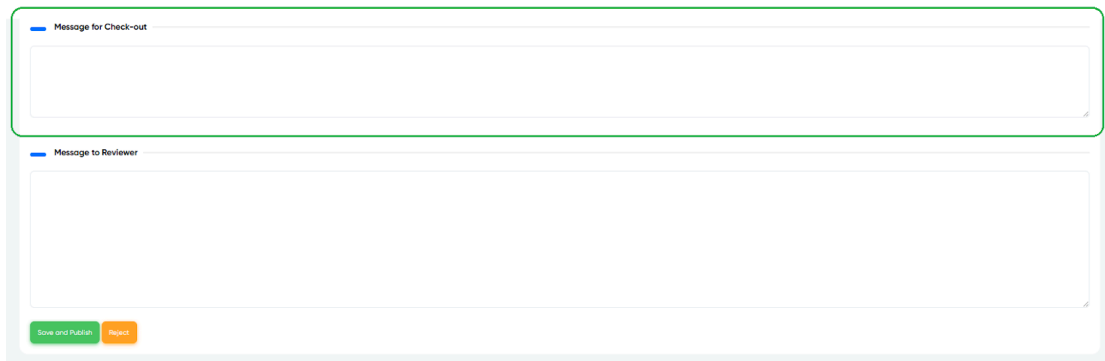

We want to implement a Modular Checkout System in Rocket LMS. The Super Admin defines predefined checkout modules (e.g., Days, Hours, Staff Member, Persons, Extra Services, Cancellation Policy). Each Organization/Instructor can enable or disable these modules for their Products/Courses/Bookings/Bundles via their settings panel. On the checkout page, only the enabled modules should appear, rendered through Blade partials and stored in an

`order_meta` table. The system must support validation rules, mapping to the database, and be extensible for future modules (e.g., meal plans, special requests).

Create predefined options, for Check-Out, that are enabled/activated by the Organization/Instructor

3.6.1 Extra Field at (Products/Courses/Bookings) + Bundles

3.6.1.1) Future State (Admin/BackEnd) (Organization/Instructor) -> edit -> (Product/Course/Booking)+Bundles

3.6.2 Modular Checkout System for Rocket LMS

I). Admin → Checkout Field Groups

- The Super Admin, will define pre-configured modules (not free-form fields).

Example modules:

- Days (date picker)
- Hours (time slot selector)
- Staff Member (dropdown of instructors/staff)
- Persons + Children (quantity steppers with age groups)
- Extra Services (checkboxes with additional cost)
- Cancellation Policy (information + checkbox)

Each module has:

- Label (title shown in checkout)
- Input type (date picker, select, toggle, repeater, etc.)
- Validation (required/optional)
- Mapping (where data is stored in the database).

II). Organization / Instructor Settings

- In the Edit User → Checkout Settings panel (like in your screenshot), each Organization/Instructor can enable/disable modules via toggles.
- Example usage:
 - Hotel → enables Days + Hours + Persons+Children

- **Fitness Trainer** → enables **Hours + Staff Member**
- **Online Shop** → disables all → default checkout only

III). Checkout Rendering

- **On the Cart/Checkout page:**
 - The system loads only the modules enabled for that **Organization/Instructor**.
 - Each module is rendered using its Blade partial (`_checkout_days.blade.php`, `_checkout_hours.blade.php`, etc.).
 - Data is saved into an `order_meta` table (e.g. `order_id`, `key`, `value`).

IV). Database Structure

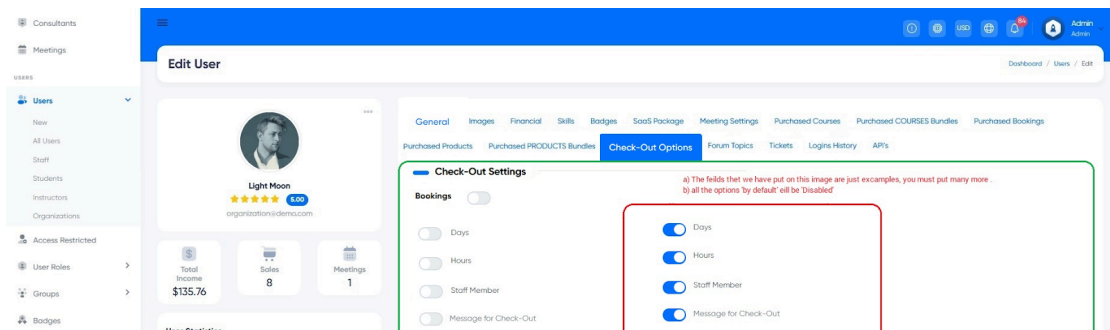

- **Table: `org_checkout_modules`**
 - `org_id`
 - `module_name`
 - `enabled` (boolean)
- **Table: `order_meta`**
 - `order_id`
 - `key` (module_name)
 - `value` (submitted data)

◆ **Extensible:** new modules can be added later (e.g. **Meal Plan, Special Requests**).

- **Module Schema definition:** `checkout_modules` array (name, input_type, config JSON, price_rule, order_index, is_active) + `checkout_module_translations` (labels/help per locale).
- **Entity mapping:** except for Organization/Instructor level, override per Product/Course/Booking (e.g. `entity_checkout_modules`: entity_type, entity_id, module_id, enabled, config_override JSON).
- **Validation/Conditional Logic:** support required, patterns, min/max, dependencies (e.g. if Days ⇒ show Hours).
- **Pricing:** rules that affect the amount (e.g. additional services, people) with clear brackets on the cart total (subtotal → taxes → discounts → module extras).
- **Ordering & UX:** `order_index` field for display order + help texts/tooltips.
- **Timezones & Morphs:** normalization of dates/times to UTC, locale-aware display.
- **Multi-item Cart:** modules to be tied per line item (not global), especially when the cart has items from different organizations.
- **Data Storage:** in addition to `order_meta`, and `order_item_meta` (`order_item_id`, `key`, `value`) for granular elements.
- **Cancellations/Changes:** how to “lock” or change module values in cancel/refund/reschedule (audit trail).
- **RBAC/Permissions:** who creates modules (Super Admin), who activates them (Org/Instructor), who overrides at the entity level.

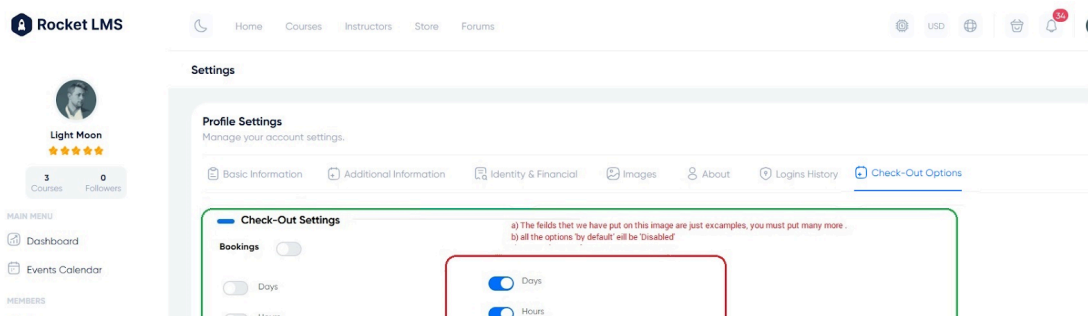

3.6.2.1) Future State (Admin) (Organization/Instructor) -> edit -> (Product/Course/Booking)+Bundles

3.8 API

GOAL -> +booking + qr Codes, Short codes + (ADMIN) QR Code, at certificates

The goal is to implement a modular API integration in Rocket LMS that enables vendors to synchronize products, orders, customers, payments, and bookings in real time with our ERP, while supporting both own products and dropshipping. The system will include configurable “abilities” (Import, Export, Booking, Dropshipping) that can be created dynamically from the backend through a “+ new ability” function, allowing Admins or Vendors to define new Import/Export connections. All abilities will be stored in structured JSON/DB for flexibility and easy extension with future modules (e.g., Video Calls, e-Tickets). Additionally, the platform will integrate QR codes and short links (via Premium URL Shortener) across products, courses, bundles, orders, invoices, and certificates, with full logging, analytics, and check-in flows.

Flow 1	Rocket LMS	-> ERP (perfex)	-> other Accounting systems
Flow 2	Import + sync, products from other producers (inventory, details)	-> ERP (perfex)	-> Rocket LMS
Flow 3	Rocket LMS	-> ERP (perfex)	-> other ecommerces/marketplaces. (the customer (business)) acts as a supplier, for another dropshipper
3.8.4 QR code	Rocket LMS	<-> QR saas **	Embed QR code/ srt link Truck: Check-in Logs

** [Premium URL Shortener](#)

Flow 1 and flow 2:	
API Base URL	domain-name.com/_ERP/api/v1/clients
API Key	abc123
+ a toggle field 'import_dropshipping_enabled'	
Flow 3:	

API Base URL	domain-name.com/_ERP/api/v1/supplier-feed
API Key	efg456

Implementation ->

The implementation will follow a modular design where each integration (Import, Export, Booking, Dropshipping) is created as an independent “ability block” in the backend. A central configuration panel will allow Admins to add new abilities with a “+ new ability” button, assign them to vendors, and enable/disable them via toggles. All mapping fields (e.g., Customer → Client, Product → Item, Order → Invoice, Booking → Appointment, Payment → Payment) will be stored in structured JSON/DB tables, ensuring that each block is self-contained and easily extendable. Real-time synchronization will be handled via jobs, queues, and webhooks with retries for reliability. Vendors who subscribe will be given an API key/token to access ERP data, while non-subscribers will still have their data synced but without ERP access. The system will also integrate QR codes and short links using Premium URL Shortener, embedding them in products, courses, bundles, invoices, emails, and certificates, with full logging of scans and analytics for tracking and check-in workflows.

1. Modular Abilities Framework

- Create a configuration backend for abilities (Import, Export, Booking, Dropshipping).
- Add “+ new ability” button in Admin panel → generates new block.
- Each ability stored in structured JSON/DB table (fields, mappings, settings).
- Add enable/disable toggle for each block (per vendor).
- Vendors see active abilities in profile settings.
- Support extension with new modules (e.g. Video Calls, e-Tickets).

2. ERP API Integration (Perfex ERP)

2.1) Enable ERP REST API.

2.2) Create mechanism for API keys per vendor (with permissions + dropshipping toggle).

2.3) Define mapping tables for ID mapping (Rocket IDs ↔ ERP IDs).

2.4) Implement core mappings:

- ❖ Customer → Client
- ❖ Product → Item Variants  Variants
- ❖ Order → Invoice
- ❖ Booking → Appointment -> Appointly  Appointly
- ❖ Payment → Payment

2.5) Build sync flows:

- ❖ Flow 1 (Own Products): Rocket LMS → ERP → Accounting
- ❖ Flow 2 (Dropshipping): Supplier/ERP feed → ERP → Rocket LMS
- ❖ Flow 3 (Export): Rocket LMS → ERP → External Marketplaces

2.6) Real-time sync via queues, jobs, retries + webhooks for updates.

2.7) ERP Access Control:

- ❖ If vendor subscribes → API key/token issued

- ❖ If not → data synced silently (no ERP access)

2.8) External ERP Support → expose public API + webhooks.

3. QR Codes & Short Links (Premium URL Shortener)

3.1 Setup Premium URL Shortener (PUS) on subdomain (e.g., s.domain.com) + generate API token.

3.2 Add DB fields to products, courses, bookings, bundles:

qr_enabled (boolean), short_url, short_code, qr_image_path,
qr_last_refreshed_at, qr_revoked_at.

Create new qr_scan_logs table (logs of scans, IP, user_agent, referrer, user_id, check-in flag).

3.3 Service Layer (PusClient.php):

- ❖ createLink(), deleteOrDisable(), getQrImage(), getStats().
- ❖ Handle errors + retries.

3.4 Business Logic:

- ❖ On item create/update → if qr_enabled = true → generate short URL + QR, save to DB.
- ❖ Add “Re-Create” and “Disable” buttons.

3.5 Redirect & Logging:

- ❖ Create /r/{code} route → logs scan → redirects to canonical URL.

3.6 UI/UX Integration:

- ❖ Backend: toggle for QR, preview QR, copy/download buttons.
- ❖ Frontend: “Share this ...” card with QR + short link.
- ❖ Emails (order confirmation), Invoices, Certificates → embed QR + short link.

3.7 Check-in Flow:

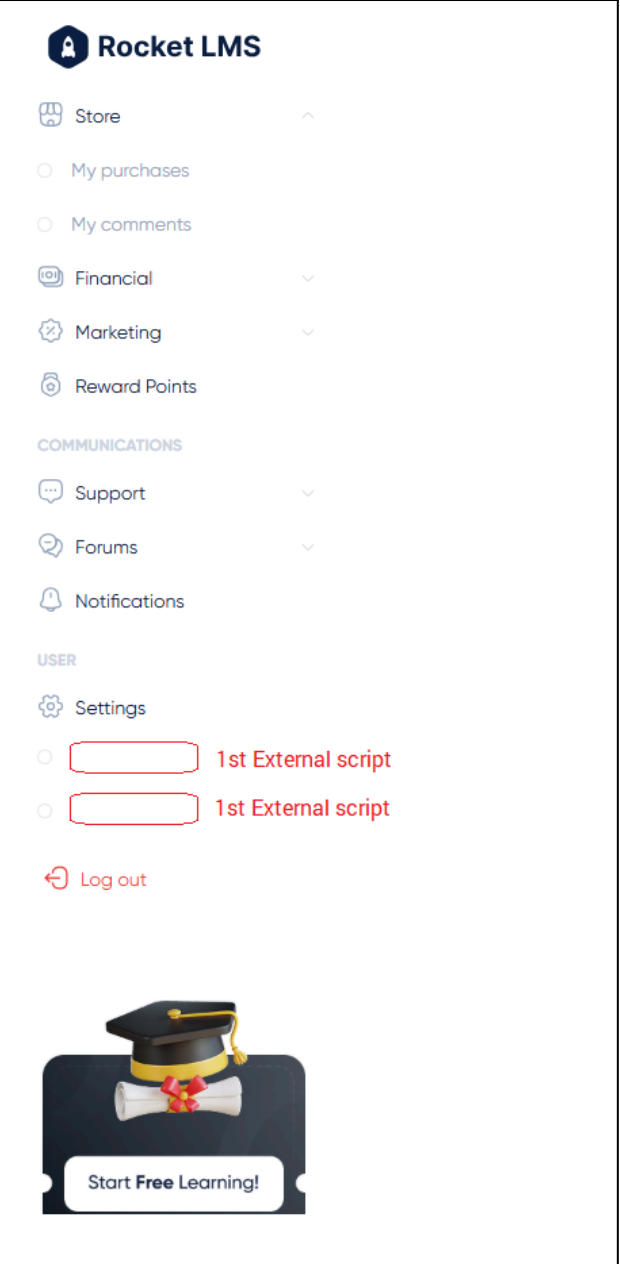

- ❖ API endpoint /api/checkin/{code} → validate ownership, log scan as check-in.

3.8 Analytics Dashboard:

- ❖ Total scans, unique IPs, referrers, check-ins (filters by vendor, item, date).

(+) Extended Import/Export Abilities & Invoice Actions

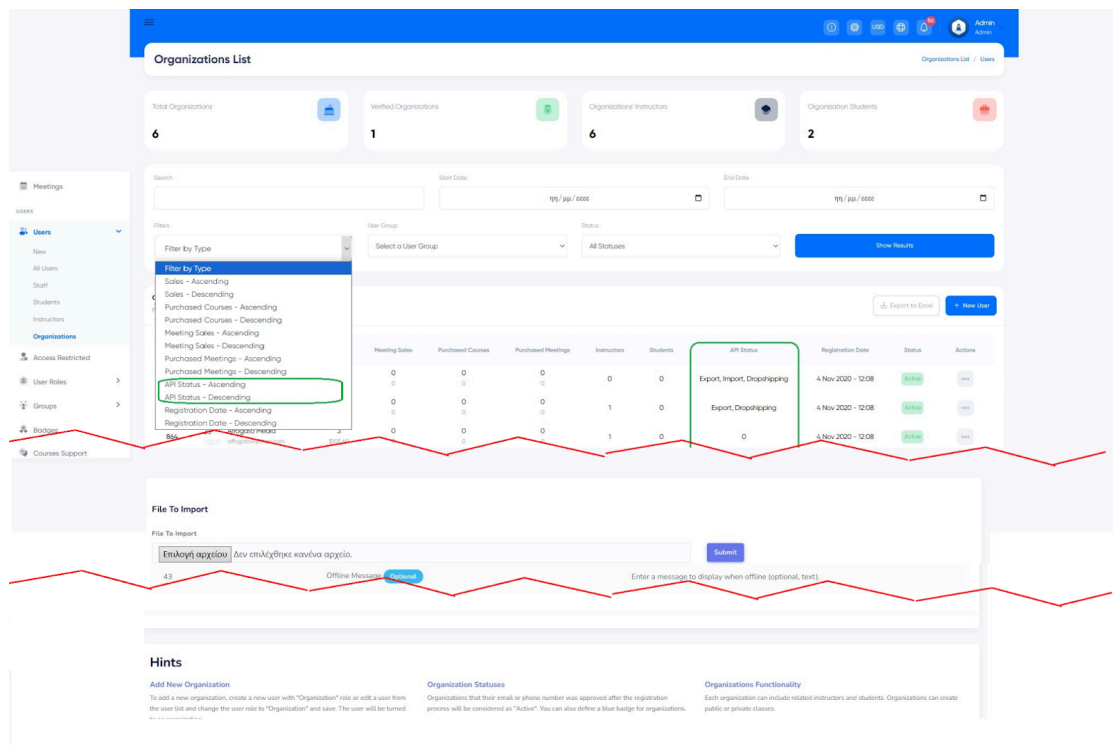

In addition to the predefined flows, the platform must support the dynamic creation of new Import and Export abilities directly from the Admin panel through a “+ new ability” button. This feature allows Admins to define new integration blocks (e.g., Import Products from Supplier X, Export Bookings to Marketplace Y) without custom development each time, making the system fully modular and extensible. Each ability block is stored in structured JSON or dedicated database tables, includes a toggle to enable or disable it per vendor, and can be easily extended with new fields or modules in the future. On the Invoice side, beyond embedding a QR code for quick access, the interface must also provide preview and download actions, ensuring that vendors and customers can view, share, and print their documents seamlessly.

perfix (Customer) menu, must duplicate it, in Rocket LMS (Backend) <u>Customer</u> menu (even with iframe) perfix (Company's, Seller) menu, must duplicate it, in Rocket LMS (Backend) <u>Instructor</u> / <u>Organization</u> menu (even with iframe) Ultimate URL Shortener (Customer) menu, must duplicate it, in Rocket LMS (Backend) <u>Customer</u> menu (even with iframe) Ultimate URL Shortener (Company's, Seller) menu, must duplicate it, in Rocket LMS (Backend) <u>Instructor</u> / <u>Organization</u> menu (even with iframe) Choud Desk 3 (Customer) menu, must duplicate it, in Rocket LMS (Backend) <u>Customer</u> menu (even with iframe) Choud Desk 3 (Company's, Seller) menu, must duplicate it, in Rocket LMS (Backend) <u>Instructor</u> / <u>Organization</u> menu (even with iframe)	
--	---

We want to add new menus to the Rocket LMS backend that will replicate the menus of the Perfex, Ultimate URL Shortener, and Choud Desk 3 applications so that users can access them directly from within the Rocket LMS environment. Specifically, for customers, the corresponding menus must be added to the Customer menu, while for sellers or instructors (Company's Seller/Instructor/Organization), they must be added to their own menus (Instructor/Organization menu). Integration can even be done via iframe, allowing external applications to be viewed within Rocket LMS without requiring a full technical connection or integration.

3.9) Roles - Access Levels

LEVELs: Admin + Backend + FrontEnd

3.9.1 Instructor -> Instructor, Seller, Operator (Tour), Event Organizer, Agent

3.9.2 Organization -> Businesses Seller, Businesses Producer, Businesses Services, Tour Operator, Agency / OTA

3.9.3 Customer -> Individual, Student, Store, Wholeseller, Importer, Advertiser, Promoter, Travel Agency / OTA, Tour Operator

GOAL->

Implement multi-role onboarding & management in Rocket LMS so that:

- A user registers with one initial role (from Instructor / Organization / Customer families and sub-roles).
- After first login, in Profile → Basic Information the user sees their current role(s) and a button “Add role.”
- On click, show a confirmation popup (“Are you sure?”). If Yes → choose new role from a filtered list (exclude already active/pending roles & supersets); if No → close.
- Once a new role is chosen, the tab area (Regulatory & Badges section) shows the corresponding form(s) for that role (stacked if multiple).
- The user fills & submits each role form.
- Admins review per-role submissions and Approve/Reject.

- Upon approval, the user gains the permissions & menus for that role.
- Products/courses/etc. can optionally be restricted by customer groups/roles so at checkout/cart unauthorized users see a denial message.

This ensures:

- One account with many capabilities.
- Clean UI and auditability.
- No duplicate accounts.
- Role evolution (upgrade/add parallel roles).

Implementation->

1) Roles & Visibility (Admin)

- Role catalog (User Roles → New/List).
- Fields: `name`, `caption`, `active`, `visible_in_registration`, `requires_approval`, `level` (`Instructor/Organization/Customer`), `is_superset_of` (JSON array).
- Permissions via existing checklists (Webinars, Store, Financial, etc.).
- **Supersets** prevent offering downgrade roles (e.g., Instructor shouldn't see Student).

2) Role-Form Mapping (Forms not ready yet)

- Create one **Form Builder form** per sub-role (`role:businesses_seller`, `role:operator_tour`, `role:importer`, etc.).
- Mapping table (DB or JSON):
`-role_forms(role_key, form_slug, is_required)`
`-user_role_forms(user_id, role_key, submission_id, status)`
- Store submissions in Form Builder (no new schema).
- For now → allow empty mapping or placeholders (Admin can attach later without code changes).

3) Database (Minimal Additions)

- `user_roles(id, user_id, role_key, status ENUM(pending, active, rejected, revoked), requested_at, approved_at, approved_by, notes)`
- Optional: `users.active_role_key` (for UI focus).
- `role_rules` (JSON or DB table) for:
 - `eligibility` (what new roles are available given current roles)
 - `supersets` (which roles imply others)
 - `customer_groups` (for purchase restrictions)
- Indexes: `(user_id, role_key)`, `(status)`
- Uniqueness: one user cannot have duplicate role keys.

4) Registration Flow

- **Step 1:** Choose role → data-driven from roles with `visible_in_registration=true`.
- **Step 2:** Load mapped form (Form Builder). Validate & create account.
- If `requires_approval=true` → user_roles status = `pending`.
- Else → auto active.

5) Post-Login Role Management (Profile)

- In **Profile** → **Basic Info** show badges of current roles (Active/Pending).
- Button: “Add role.”
- Flow:
 - Confirmation popup: “Are you sure you want to apply for {Role}?”
 - If yes → dropdown of allowed roles.
 - Apply eligibility rules & supersets.
 - On select → role request created + mapped form appears stacked.
 - User submits → goes pending until approved.

6) Admin Review & Operations

- New queue: **Users** → **Role Requests**.
- Filters: role, status, date, user.
- Inline view of Form submissions.
- Approve/Reject → update `user_roles`, trigger notification.
- Audit log: who/when/why.
- Resubmit allowed on reject (keeps history).

7) Menus, Permissions & UI Context

- Menus based on **permissions**, not hardcoded role names.
- Optional: “Active role context” selector (UI cleaner).
- After approval, clear cache & refresh menus.

8) Product/Course Access by Customer Group

- In Create/Edit product/course/booking add multi-select **Customer Group**.
- At checkout: verify logged-in user has any of the allowed groups.
- If not → popup denial message (“You must be Importer or Operator”).
- Server-side enforcement required (not only UI).

9) Notifications & Emails

- Triggers:
 - `role_request_created`
 - `role_request_approved`
 - `role_request_rejected` (with reason)
 - `role_docs_missing`
- Reuse “Become Instructor” & “Verification” templates as base.

10) Security & Compliance

- Private storage for uploads.

- File limits: size/type.
- Access control: Admin + (Org owner if relevant).
- Retention policy + delete on request.
- Optional virus scan.

11) Acceptance Criteria

- Register with any role → correct form loads.
- Add role shows only **eligible & non-superseded roles**.
- Popup confirm works.
- Forms appear stacked.
- Admin approves → permissions instantly updated.
- Restricted product blocks unauthorized users.
- Drafts not in admin queue.
- Reject shows reason + resubmit possible.

JSON Example (Eligibility & Supersets)

```
{
  "eligibility": {
    "student": ["instructor", "organization"],
    "instructor": ["organization"],
    "organization": []
  },
